CFDEM[®]
PROJECT

Motivation

- Particles in reality are mostly non-spherical. Still many DEM and CFD-DEM codes employ only perfect spheres

- Detailed information on solid and fluid velocities is difficult to achieve in experiments -> need to simulate
- Simulate at high level of details (resolved CFD-DEM) to apply the received knowledge at low level of details (unresolved CFD-DEM)

- Solve Navier-Stokes equations in complex domains:

$$\begin{cases} \nabla \cdot \mathbf{u} = 0 \\ \frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{u} = -\nabla p / \rho + \nu \Delta \mathbf{u} \\ + \text{boundary and initial conditions} \end{cases}$$

- Complex domains are particulate systems comprising spherical or **non-spherical** particles (much bigger than a CFD cell). Dirichlet boundary condition must be fulfilled:

$\mathbf{u}(x \in \partial\Omega_i, t) = \mathbf{v}_i^{surf}$ treated by extra source term \mathbf{f}_{IB} in the momentum equation

- Particles can be static or moving:

$$m_i \frac{d^2 \mathbf{x}_i}{dt^2} = \mathbf{F}_{ext} + \mathbf{F}_{pp} + \mathbf{F}_{pw} + \mathbf{F}_{pf}$$

+ rotational motion

External force field
(gravity, electric field)

Particle-particle forces

Particle-wall forces

Particle-flow interaction

Superquadric shape

Superquadrics in Discrete Element Method:

Podlozhnyuk et al. „Efficient implementation of superquadric patrticles in DEM within an open-source framework“ (2016, submitted manuscript)

$$a = b = c,$$

$$n_1 = n_2 = 2$$

$$f(\mathbf{x}) \equiv \left(\left| \frac{x}{a} \right|^{n_2} + \left| \frac{y}{b} \right|^{n_2} \right)^{\frac{n_1}{n_2}} + \left| \frac{z}{c} \right|^{n_1} - 1 = 0$$

$$\mathbf{x} = (x, y, z)^T \quad n_1 \geq 2, n_2 \geq 2^*$$

In local coordinate system!

$$F(\mathbf{X}) = f(\mathbf{A}^T \cdot (\mathbf{X} - \mathbf{X}_C))$$

In global (observer fixed) coordinate system!

*A.H. Barr, *Superquadrics and Angle-Preserving Transformations*, IEEE Computer Graphics and Applications, vol.1, no. 1, pp. 11-23, January-March 1981

$$a \neq b \neq c,$$

$$n_1 = n_2 = 2$$

$$n_1 \gg 2, n_2 = 2$$

$$n_1 \gg 2, n_2 \gg 2$$

Standard Immersed Boundary method* (cfdemSolverIB)

- Directly impose the fluid velocity inside a particle as on the sketch
- Make 1 step by PISO solver, find new pressure \tilde{p} and velocity \tilde{u} .
- Correct new velocity \tilde{u} such that it is divergence free:

$$u^{n+1} = \tilde{u} - \nabla \varphi$$

$$\text{where } \Delta \varphi = \nabla \cdot \tilde{u}$$

- Update pressure:

$$p^{n+1} = \tilde{p} + \rho \frac{\partial \varphi}{\partial t}$$

Force and void fraction calculation

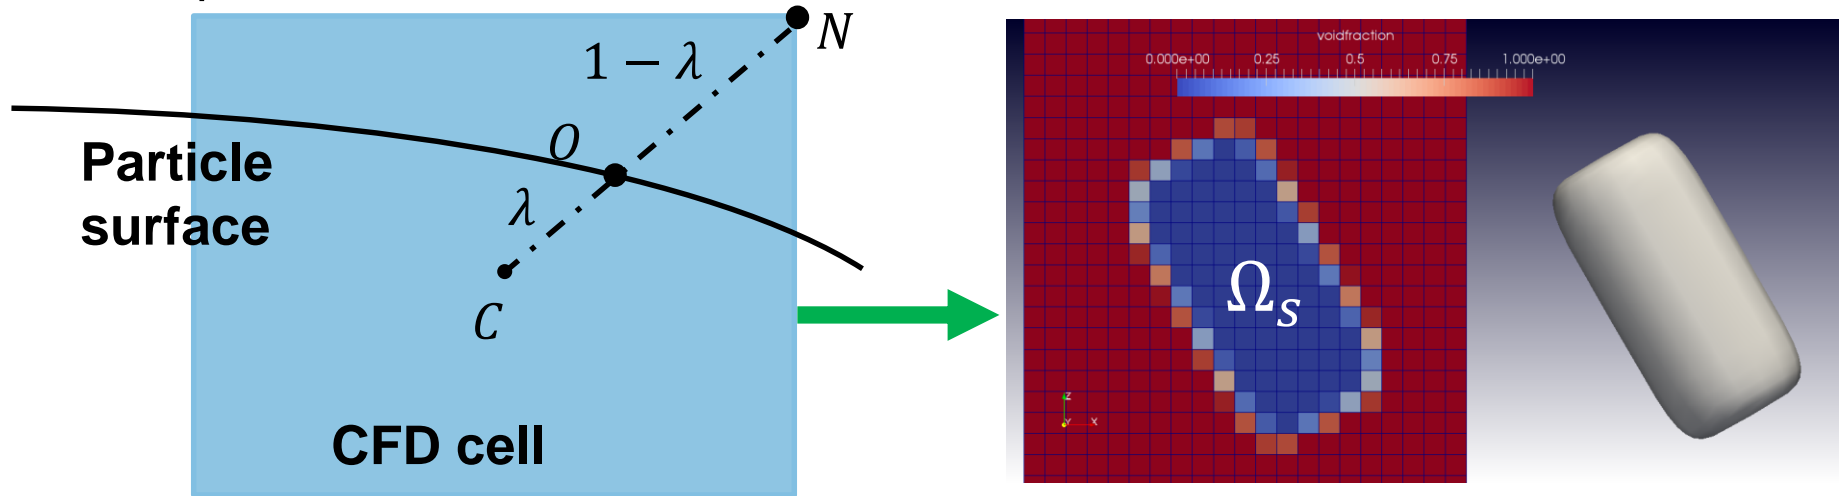

DCS
COMPUTING

LIGGGHTS®

CFDEM®
COUPLING

CFDEM®
PROJECT

- Requires calculation of the void fraction α

- Each intersection of center-node line segment with a particle surface gives $-\lambda/8$ to the void fraction field α .
- $\lambda = OC/CN$, where O is the intersection point. A few iterations required for superquadrics.
- Max error: 10%
- Calculate force acting on a particle:

$$\mathbf{F}^* = \int (-\nabla p + \mu \Delta \mathbf{u}) d\Omega_s \approx \sum (-\nabla p + \mu \Delta \mathbf{u})(1 - \alpha_i) V_i$$

A.A. Shirgaonkar, M.A. MacIver and N.A. Patankar, A new mathematical formulation and fast algorithm for fully resolved simulation of self-propulsion, J. Comput. Phys., 228, (2009) 2366-2390

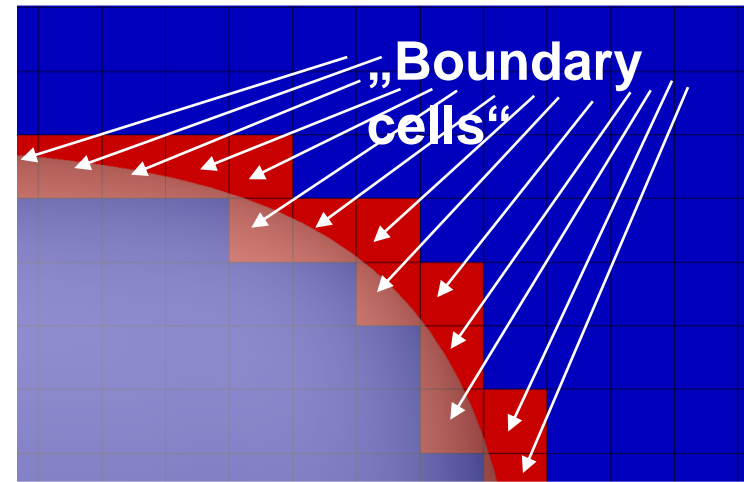

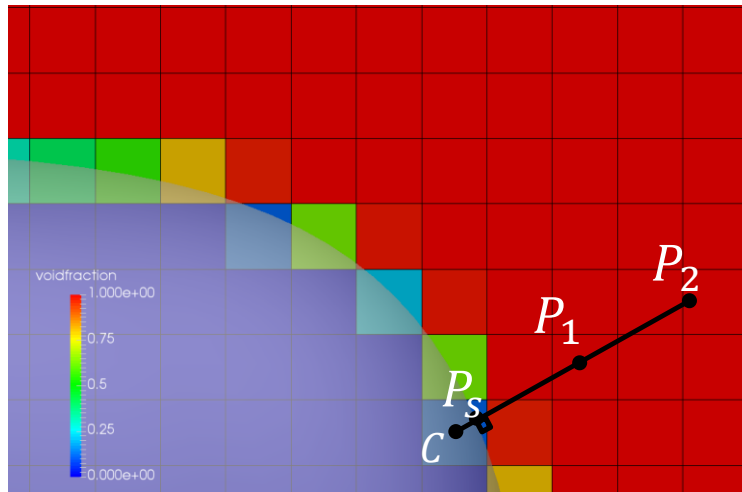

Hybrid Fictitious Domain-Immersed Boundary Method (HFDIBM)

DCS
COMPUTING

LIGGGHTS®

CFDEM®
COUPLING

CFDEM®
PROJECT

- Dirichlet condition: $\mathbf{u}(P_S) = 0$, where P_S is the projection of the cell center onto the particle surface
- $\mathbf{u}(P_1)$ and $\mathbf{u}(P_2)$ are interpolated by OpenFOAM, „desired“ fluid velocity \mathbf{u}_C^* at the cell center C is reconstructed by 2nd order interpolation using $\mathbf{u}(P_1)$, $\mathbf{u}(P_2)$, $\mathbf{u}(P_S)$.
- PISO-IB* forcing term (Newtonian acceleration):

$$\mathbf{f}_{IB}^C = \frac{\mathbf{u}_C^* - \mathbf{u}_C}{\Delta t}$$

used explicitly in PISO-loops. \mathbf{u}_C is the current fluid velocity at C . No additional velocity-correction loops are required.

- However, \mathbf{f}_{IB}^C is applied only to the „boundary cells“

HFDIBM – implementation details

DCS
COMPUTING

LIGGGHTS®

CFDEM®
COUPLING

CFDEM®
PROJECT

Fully parallel:

- Interpolation points can be situated on different processors. Problem solved
- Particle can be divided by more than 2 processors on CFD side. Problem solved.

- Distance δ between interpolation points $\sim 1 - 2$ of mesh element size.
- Fluid-particle force:

$$\mathbf{F} = \rho_{fluid} \sum_{i \in BC} \mathbf{f}_{IB}^i V_i$$

- To find P_s we assume that the gradient of the superquadric shape at C function is almost orthogonal to the surface. Thus, just find the surface-line intersection point

Sedimentation of a single sphere

Parameter	Value
Fluid density, kg/m^3	960
Fluid viscosity, $10^{-3} N \cdot s/m^2$	58
Max Re	32
Sphere diameter, m	0.015
Domain size, $m \times m \times m$	$0.1 \times 0.1 \times 0.16$
Mesh size	$40 \times 40 \times 64$
Mesh refinement level	2
Cells per diameter	24
Domain decomposition, $N_x \times N_y \times N_z$	$2 \times 2 \times 1$
CFL number	0.2

HFDIBM gives time-velocity curve in very good agreement with the experiment!

*Liao et al. , Simulating flows with moving rigid boundary using immersed-boundary method, 2010

Flow past a non-spherical particle

Parameter	Value
Fluid density, kg/m^3	1
Inlet velocity, m/s	1
Diameter of the volume equivalent sphere, m	1
Domain size, $m \times m \times m$	$12 \times 6 \times 6$
Mesh size	$60 \times 30 \times 30$
Mesh refinement level	2
Cells per diameter	20
Domain decomposition, $N_x \times N_y \times N_z$	$1 \times 2 \times 2$

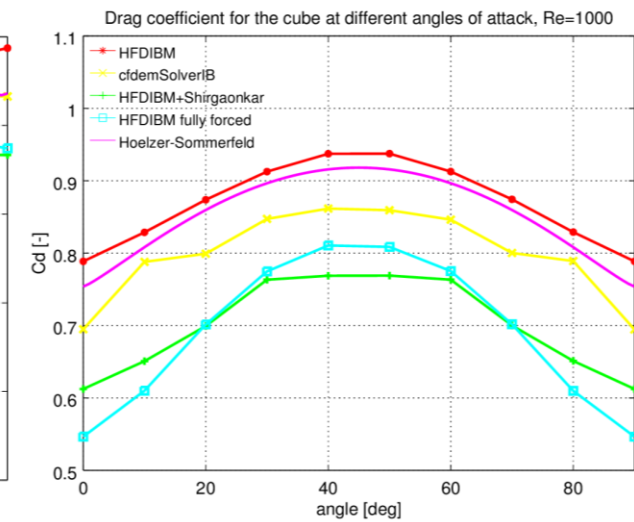

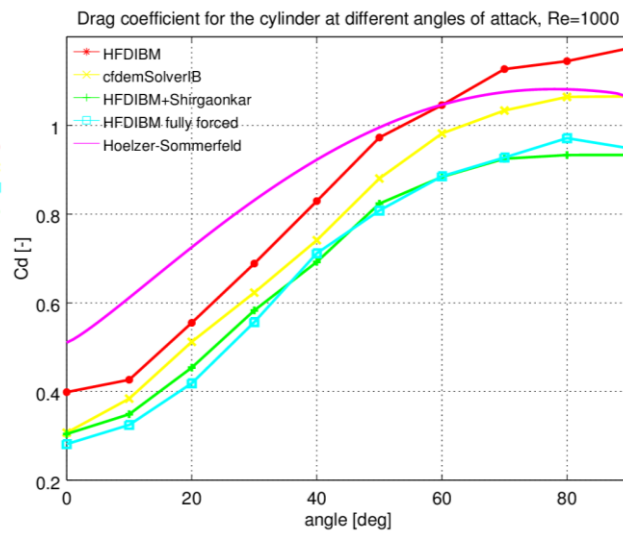

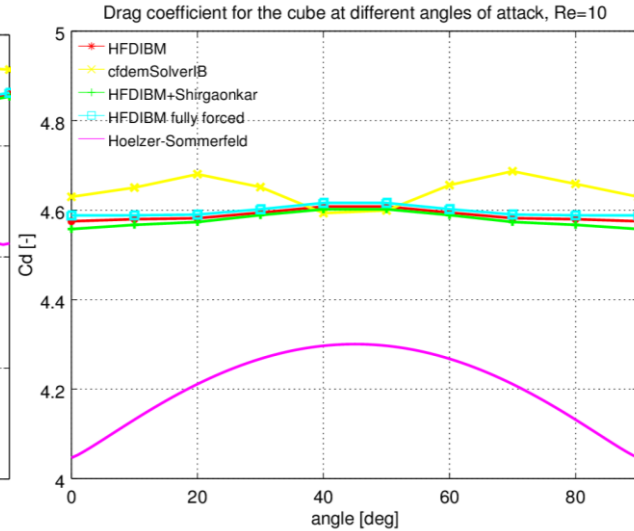

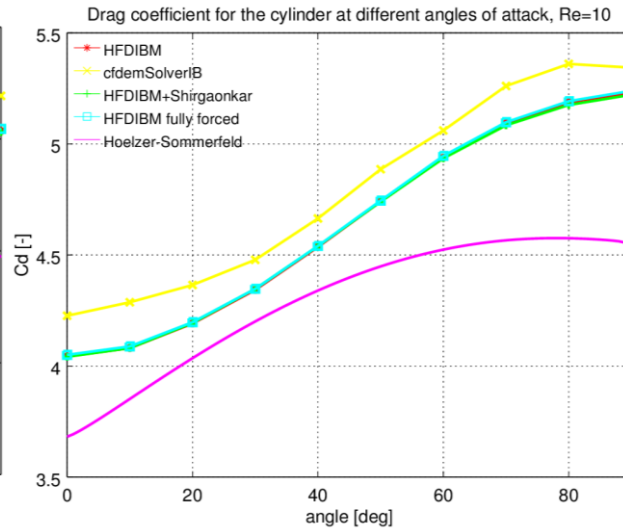

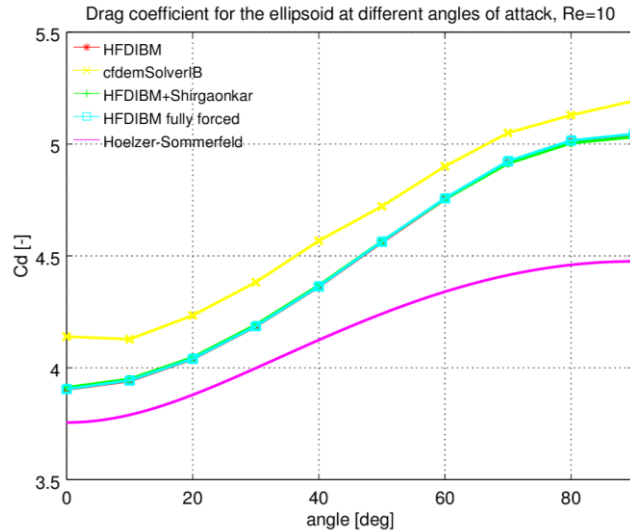

Compare with Hölzer-Sommerfeld* drag:

$$C_D = \frac{8}{Re_p} \frac{1}{\sqrt{\Phi_{\perp}}} + \frac{16}{Re_p} \frac{1}{\sqrt{\Phi}} + \frac{3}{\sqrt{Re_p}} \frac{1}{\Phi^{3/4}} + 0.42 \cdot 10^{0.4(-\log_{10} \Phi)} \frac{1}{\Phi_{\perp}}$$

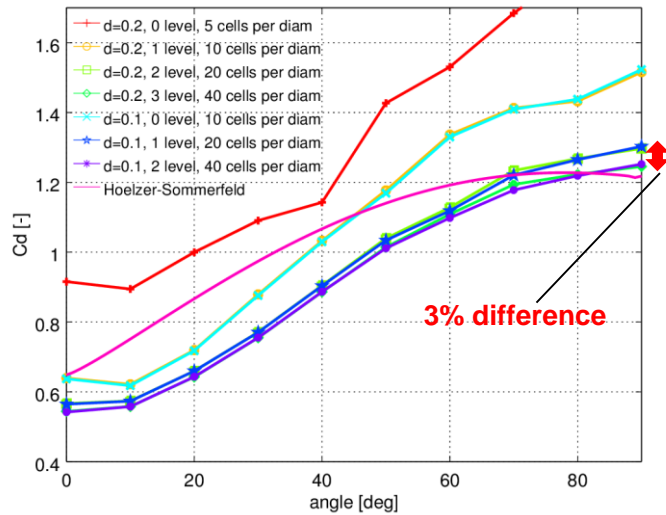

*Hölzer and Sommerfeld, *New simple correlation formula for the drag coefficient of non-spherical particles*, 2008

Comparison of drag coefficients

Mesh convergence

Drag coefficient for the cylinder at different angles of attack, HFDIBM solver, $Re=300$

Drag coefficient for the cylinder at different angles of attack, HFDIBM, no interp, $Re=300$

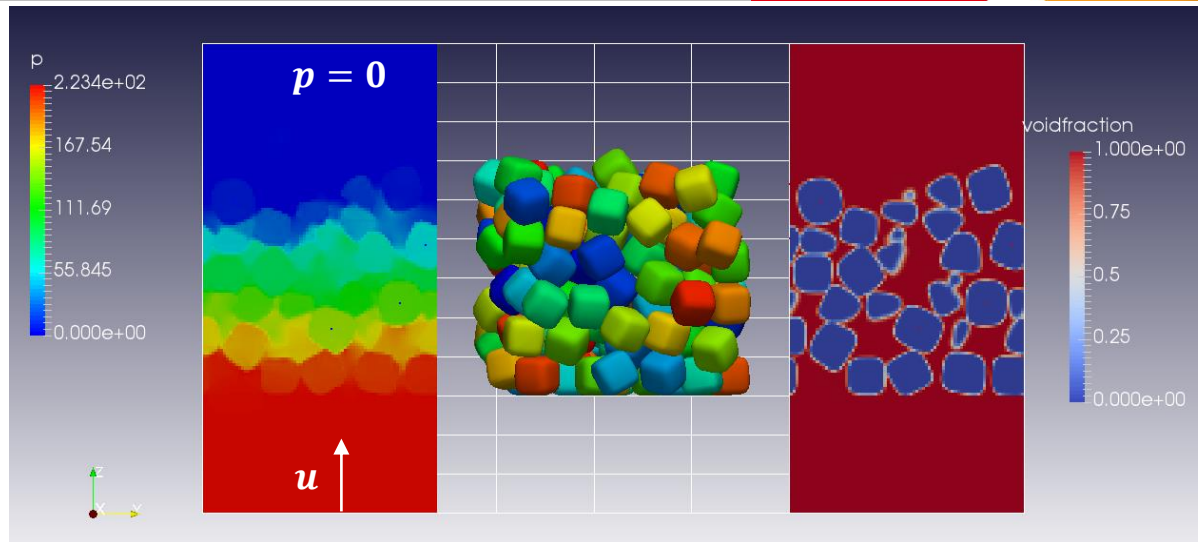

A cylinder at different angles of attack
 $Re = 300$

Mesh size (in blockMeshDict), d, m	Refinement level	Number of mesh elements	Cells per diameter
0.2	0	54000	5
0.2	1	~60500	10
0.2	2	~102000	20
0.2	3	~380000	40
0.1	0	432000	10
0.1	1	~473000	20
0.1	2	~752000	40

Optimal mesh size!
Finer meshes produce results with 3% difference requiring at least 4 times more computational time

Flow through a packed bed. Pressure drop

Parameter	Value
Number of particles	150
Domain size, $mm \times mm \times mm$	$12 \times 12 \times 24$
Particle size, $mm \times mm \times mm$	$1 \times 1 \times 1$
Mesh size, elements	$80 \times 80 \times 160$
Inlet velocity u , m/s	1
Viscosity μ , $Pa \cdot s$	0.0001
Bed height, mm	11 ± 0.5

Ergun equation:

$$\frac{\Delta p}{L} = \frac{150\mu(1 - \varepsilon)^2}{d^2 \varepsilon^3} u + \frac{1.75\rho(1 - \varepsilon)}{d \varepsilon^3} u^2$$

- Ergun equation gives $\Delta p = 273 \pm 80 Pa$
- HFDIBM gives $\Delta p = 221 Pa$
- cfdemSolver gives oscillating Δp , far from being within uncertainty interval given by Ergun equation
- HFDIBM with full body forcing behaves non-stable

Why do we need this

Example of unresolved CFD-DEM simulation: Fluidization

Goal: to „model“ a single CFD cell
in **unresolved** CFD-DEM by
means of resolved CFD-DEM

Find a new drag correlation for dense
systems

- We want to model flows through dense systems (e.g. fluidized beds) using unresolved CFD-DEM.
- Effect of tortuosity?

$$T = \frac{\text{average streamline path}}{\text{Domain size}}$$

$$T = \frac{\langle u \rangle}{\langle \mathbf{u} \cdot \mathbf{n} \rangle}$$

Thank you for attention!
